

IT Health Evaluation

IT optimised

In today's modern organisation the IT Infrastructure is crucial to productivity. IntaStella is able to measure and document your companies performance, capacity, security and resilience. More importantly, we'll highlight any problems identified, along with their severity and suggested solutions.

The main areas covered by a full health evaluation are:

- Business growth plans
- Network topology & infrastructure
- Network devices
- Software suitability
- Network security
- Backup and data security
- Management & standardisation

IT health evaluations are invaluable to any organisation. They give business and IT Managers confidence that their IT infrastructure is performance optimised and capable of recovering from an array of disasters.

Our Health Evaluations have outlined some of these more typical shortcomings :

- Inadequate backup solutions, configurations and procedures rendering companies unable to restore all required data following a disaster
- Ineffective network security configurations resulting in exposed networks
- Inadequate Anti-Virus and content management systems coverage
- Planning omissions resulting in the purchase of unsuitable and short term backup solutions
- Poor broadband network implementation and configuration
- Data bottlenecks resulting in network congestion and latency

Performance IT
